“AI - Based Fake News Detection System”

Name of Student's : 1. Roshani Patharkar 2. Shweta Pattewar 3. Swaroop Tayde 4. Rohan Suryawanshi

Name of the Guide : Mr. Sagar S. Neralkar

Academic Year : 2025- 2026

Introduction: Fake news spreads rapidly on social media platforms, making it difficult for users to verify whether information is real or misleading. The AI-Powered Fake News Detection System automatically analyzes user-entered news claims and predicts whether they are True, False, or Uncertain. The system uses multiple Artificial Intelligence and Natural Language Processing (NLP) models, semantic similarity, stance detection, online references (Google News, Reddit), and credibility signals to generate an explainable verdict.

System Architecture:

Methodology:

Conclusion: The Fake News Detection System efficiently verifies online claims using a combination of AI models, real-time references, and logical analysis. By integrating semantic similarity, stance detection, credibility signals, and user-contributed data, the system provides transparent, explainable, and reliable predictions. This helps users avoid misinformation and promotes responsible information sharing.
